STORMWATER MANAGEMENT REPORT

SITE PLAN

ASSESSORS MAP 130D LOTS 117, 247, 248, & 447  
2904 & 2914 ACUSHNET AVENUE  
NEW BEDFORD, MASSACHUSETTS

PREPARED FOR:

T.M. CROWLEY & ASSOCIATES  
14 BREAKNECK HILL ROAD, SUITE 101  
LINCOLN, RI  02865
Project Summary
The project area associated with this project is bordered by Acushnet Avenue to the West of the site, commercial abutters to the North and South, and a new residential subdivision to the East of the site in New Bedford, Massachusetts. The parcel is situated in the Mixed Use Business (MUB) District. The total parcel area is approximately 98,041 S.F.

The applicant is seeking permission to construct a 5,275 S.F convenience store with a gas station and 2,640 S.F. car wash that includes a bituminous pavement parking lot containing a total of 50 spaces with associated grading. Stormwater associated with the development will be controlled via deep-sump hooded catch basins, water quality units and a cultec subsurface recharge drainage system.

Methodology
Drainage computations were performed using the Natural Resources Conservation Services (NRCS) TR-20 method and HydroCAD® Drainage Calculation Software. Sketches of the existing and proposed watershed areas, HydroCAD® Report, and copies of the calculation sheets are included as appendices to this report.

Existing Conditions
The soils underlying the site are identified in the Soil Survey of Bristol County. The Site soils are classified as Paxton Fine Sandy Loam. Paxton soils are well suited to cultivate crops, hay and improved pasture. Paxton soils have a high water capacity and are well suited for intensive agriculture and woodland production.

Proposed Conditions/Stormwater Management Overview
Under proposed conditions, roof drains will collect and direct roof runoff and runoff from the canopy above the gas station area to a subsurface recharge system which, in large storm events, will overflow to a drain manhole and will ultimately tie into the city drainage system. Runoff from the parking areas and grassed area will be collected by two deep sump catch basins which flows to a Contech CDS Water Quality Unit before ultimately flowing to the city drainage system.
The design of the stormwater system was designed for the post-development conditions to handle all storms' peak discharges and runoff volume to include the 2, 10, 25 and 100-year storm events. The site drainage system was designed in consideration of the structural standards and techniques of the Best Management Practices (BMP) and Low Impact Development (LID) outlined in the "Stormwater Management Handbook".

The results of site drainage calculations are presented in the following Tables. The results are based upon evaluation of Pre-development conditions and the design of proposed surface and subsurface drainage systems for the Post-development condition. These results show the Post-Development offsite volume and runoff rates are reduced to less than the Pre-development conditions, thus meeting the BMP guidelines for this site development.

**Table 1 - Comparison of Pre- versus Post-Development Offsite Runoff Rate, cfs**

Groundwater recharge is a factor in the design of the subsurface drainage system. Table-3 below presents the minimum recharge required and the proposed recharge of stormwater based upon the BMP methods of the "Stormwater Management Handbook". The proposed recharge quantities meet or exceed the required minimum recharges.

Total Suspended Solids Removal
In accordance with the guidelines of the Stormwater Management Policy, the Total Suspended Solids (TSS) Removal exceeds the minimum 80% requirement.
